(The Black Swan)

EXTENDED ABSTRACT

Long before current graphic, visualisation and geometric tools were available, John E. Littlewood (1885-1977) wrote in his delightful *Miscellany*¹:

A heavy warning used to be given [by lecturers] that pictures are not rigorous; this has never had its bluff called and has permanently frightened its victims into playing for safety. Some pictures, of course, are not rigorous, but I should say most are (and I use them whenever possible myself). [p. 53]

¹J.E. Littlewood, *A mathematician's miscellany*, London: Methuen (1953); Littlewood, J. E. and Bollobás, Béla, ed., *Littlewood's miscellany*, Cambridge University Press, 1986.

EXTENDED ABSTRACT

Long before current graphic, visualisation and geometric tools were available, John E. Littlewood (1885-1977) wrote in his delightful *Miscellany*¹:

A heavy warning used to be given [by lecturers] that pictures are not rigorous; this has never had its bluff called and has permanently frightened its victims into playing for safety. Some pictures, of course, are not rigorous, but I should say most are (and I use them whenever possible myself). [p. 53]

Over the past decade, the role of visual computing in my own research has expanded dramatically.

In part this was made possible by the increasing speed and storage capabilities—and the growing ease of programming—of modern multi-core computing environments [BMC].

¹J.E. Littlewood, *A mathematician's miscellany*, London: Methuen (1953); Littlewood, J. E. and Bollobás, Béla, ed., *Littlewood's miscellany*, Cambridge University Press, 1986.

But, at least as much, it has been driven by my group's **paying more active attention** to the possibilities for graphing, animating or simulating most mathematical research activities.

²See <http://www.carma.newcastle.edu.au/jon/Completion.pdf> and <http://www.carma.newcastle.edu.au/jon/dr-fields11.pptx>.

But, at least as much, it has been driven by my group's **paying more active attention** to the possibilities for graphing, animating or simulating most mathematical research activities.

- *I first briefly discuss both **visual theorems** and **experimental computation**.*
- *I then turn to **dynamic geometry** (iterative **reflection methods** [AB]) and **matrix completion problems** (applied to **protein conformation** [ABT]).² (Case studies I)*

²See <http://www.carma.newcastle.edu.au/jon/Completion.pdf> and <http://www.carma.newcastle.edu.au/jon/dr-fields11.pptx>.

But, at least as much, it has been driven by my group's **paying more active attention** to the possibilities for graphing, animating or simulating most mathematical research activities.

- I first briefly discuss both *visual theorems* and *experimental computation*.
- I then turn to *dynamic geometry* (iterative *reflection methods* [AB]) and *matrix completion problems* (applied to *protein conformation* [ABT]).² (Case studies I)
- After an algorithmic interlude (Case studies II), I end with description of work from my group in *probability* (behaviour of *short random walks* [BS, BSWZ]) and *transcendental number theory* (*normality* of real numbers [AB3]). (Case studies III)

Tools and Mathematics

Instruments for learning

Series: Mathematics Education Library

- ▶ The only book on the topic of tools and mathematics education
- ▶ Comprehensive coverage from pre-history to future directions in the field
- ▶ Content divided equally among the areas of curriculum, assessment, and policy design

This book is an exploration of tools and mathematics and issues in mathematics education related to tool use. The book has four parts. The first part sets the scene with a reflection on doing a mathematical task with different tools, a mathematician's account of tool use in his work and historical considerations of tool use. The second part opens with a broad review of technology and intellectual trends, circa 1970, and continues with three case studies of approaches in mathematics education and the place of tools in these approaches. The third part considers issues related to mathematics instructions: curriculum, assessment and policy; the calculator debate; mathematics in the real world; and teachers' use of technology. The final part looks to the future and digital tools: task design; the importance of artefacts in gameplay; and new forms of activity via connectivity.

We shall explore things like:

How random is Pi?

Remember: π is **area** of a circle of radius one (and **perimeter** is 2π).

First true calculation of π was due to **Archimedes of Syracuse** (287–212 BCE). He used a brilliant scheme for **doubling** inscribed and **circumscribed** polygons (with 'interval arithmetic')

$$6 \mapsto 12 \mapsto 24 \mapsto 48 \mapsto 96$$

Archimedes' "Method of Mechanical Theorems"

Pi movie below

Archimedes' "Method of Mechanical Theorems"

Pi movie below

... certain things first became clear to me by a mechanical method (Codex C), although they had to be proved by geometry afterwards because their investigation by the said method did not furnish an actual proof.

But it is of course easier, when we have previously acquired, by the method, some knowledge of the questions, to supply the proof than it is to find it without any previous knowledge.

Proving π is not $\frac{22}{7}$

In this case, the indefinite integral provides immediate reassurance.
We obtain

Randomness

- The digits expansions of $\pi, e, \sqrt{2}$ appear to be “random”:

$$\pi = 3.141592653589793238462643383279502884197169399375\dots$$

$$e = 2.718281828459045235360287471352662497757247093699\dots$$

$$\sqrt{2} = 1.414213562373095048801688724209698078569671875376\dots$$

Two continued fractions

Change representations often

Gauss map. Remove the integer, invert the fraction and repeat: for 3.1415926 and 2.7182818 to get the fractions below.

$$\pi = 3 + \frac{1}{7 + \frac{1}{15 + \frac{1}{1 + \frac{1}{292 + \frac{1}{1 + \frac{1}{1 + \dots}}}}}}$$

$$e = \frac{1}{1} + \frac{1}{1} + \frac{1}{2} + \frac{1}{6} + \frac{1}{24} + \frac{1}{120} + \frac{1}{720} + \dots$$

What is “random”?

A **hard** question

What is "random"?

A hard question

It might be:

- Unpredictable (fair dice or coin-flips)?
- Without structure (noise)?
- Algorithmically random (π is not)?
- Quantum random (radiation)?
Folks **believe** this is the most random.
- Incompressible ('zip' does not help)?

- Quantum random (radiation)?
Folks **believe** this is the most random.
- Incompressible ('zip' does not help)?

Conjecture (Borel) All irrational algebraic numbers are **b-normal**

Best Theorem [BBCP, 04] (**Feeble but hard**) Asymptotically all degree d algebraics have at least $n^{1/d}$ ones in binary (should be $n/2$)

Randomness in Pi?

What BBP Does?

Prior to **1996**, most folks thought to compute the d -th digit of π , you had to generate the (order of) the entire first d digits. **This is not true:**

- at least for **hex** (base 16) or binary (base 2) digits of π .

What BBP Does?

Prior to **1996**, most folks thought to compute the d -th digit of π , you had to generate the (order of) the entire first d digits. **This is not true:**

- at least for **hex** (base 16) or binary (base 2) digits of π .
- In **1996**, **P. Borwein, Plouffe, and Bailey** found an algorithm for individual hex digits of π . It produces:

 - requires **no multiple precision** software;
 - requires **very little memory**; and has
 - a computational cost **growing only slightly faster** than the digit position.
- An algorithm found by computer—now used to check record π computations and in some compilers.

What BBP Is?

Reverse Engineered Mathematics

This is based on the following then new formula for π :

$$\pi = \sum_{i=0}^{\infty} \frac{1}{16^i} \left(\frac{4}{8i+1} - \frac{2}{8i+4} - \frac{1}{8i+5} - \frac{1}{8i+6} \right) \quad (2)$$

What BBP Is?

Reverse Engineered Mathematics

This is based on the following then new formula for π :

$$\pi = \sum_{i=0}^{\infty} \frac{1}{16^i} \left(\frac{4}{8i+1} - \frac{2}{8i+4} - \frac{1}{8i+5} - \frac{1}{8i+6} \right) \quad (2)$$

- Millionth hex digit (four millionth bit) takes under **30 secs** on a fairly new PC in **Maple** (not C++ or Python) and billionth **10 hrs**.

1000 three-step uniform planar walks

The moments of an n -step planar walk:

$$W_n := W_n(1)$$

- Second simplest case:

$$W_2 = \int_0^1 \int_0^1 |e^{2\pi ix} + e^{2\pi iy}| \, dx dy = ?$$

⁴Quadrature was our first interest

The moments of an n -step planar walk:

$$W_n := W_n(1)$$

- Second simplest case:

$$W_2 = \int_0^1 \int_0^1 |e^{2\pi ix} + e^{2\pi iy}| \, dx dy = ?$$

- *Mathematica* 10 and *Maple* 18 still *think* the answer is 0 ('bug' or 'feature').

⁴Quadrature was our first interest

The moments of an n -step planar walk:

$$W_n := W_n(1)$$

- Second simplest case:

$$W_2 = \int_0^1 \int_0^1 |e^{2\pi ix} + e^{2\pi iy}| \, dx dy = ?$$

- Mathematica 10* and *Maple 18* still *think* the answer is 0 ('bug' or 'feature'?).
- There is always a 1-dimension reduction⁴

$$\begin{aligned} W_n(s) &= \int_{[0,1]^n} \left| \sum_{k=1}^n e^{2\pi x_k i} \right|^s d(x_1, \dots, x_{n-1}, x_n) \\ &= \int_{[0,1]^{n-1}} \left| 1 + \sum_{k=1}^{n-1} e^{2\pi x_k i} \right|^s d(x_1, \dots, x_{n-1}) \end{aligned}$$

⁴Quadrature was our first interest

The moments of an n -step planar walk:

$$W_n := W_n(1)$$

- Second simplest case:

$$W_2 = \int_0^1 \int_0^1 |e^{2\pi ix} + e^{2\pi iy}| \, dx dy = ?$$

- Mathematica* 10 and *Maple* 18 still *think* the answer is 0 ('bug' or 'feature').
- There is always a 1-dimension reduction⁴

$$\begin{aligned} W_n(s) &= \int_{[0,1]^n} \left| \sum_{k=1}^n e^{2\pi x_k i} \right|^s d(x_1, \dots, x_{n-1}, x_n) \\ &= \int_{[0,1]^{n-1}} \left| 1 + \sum_{k=1}^{n-1} e^{2\pi x_k i} \right|^s d(x_1, \dots, x_{n-1}) \end{aligned}$$

- So $W_2 = 4 \int_0^{1/4} \cos(\pi x) dx = \frac{4}{\pi}$.

⁴Quadrature was our first interest

Pearson's original full question

and comment on p_5

A man starts from a point O and walks l yards in a straight line; he then turns through any angle whatever and walks another l yards in a second straight line. He repeats this process n times. I require the probability that after these n stretches he is at a distance between r and $r + \delta r$ from his starting point, O .

Pearson's original full question

and comment on p_5

A man starts from a point O and walks l yards in a straight line; he then turns through any angle whatever and walks another l yards in a second straight line. He repeats this process n times. I require the probability that after these n stretches he is at a distance between r and $r + \delta r$ from his starting point, O .

“the graphical construction, however carefully reinvestigated, did not permit of our considering the curve to be anything but a straight line... Even if it is not absolutely true, it exemplifies the extraordinary power of such integrals of J [Bessel] products to give extremely close approximations to such simple forms as horizontal lines.”

- **JMAA 2016.** Our analysis of short walks extends interestingly to arbitrary dimensions (JMB, Straub, Vignat).

The radial densities for $n = 3, 4$ are **modular functions**

Let $\sigma(x) := \frac{3-x}{1+x}$. Then σ is an involution on $[0, 3]$ sending $[0, 1]$ to $[1, 3]$:

$$p_3(x) = \frac{4x}{(3-x)(x+1)} p_3(\sigma(x)). \quad (3)$$

So $\frac{3}{4}p_3'(0) = p_3(3) = \frac{\sqrt{3}}{2\pi}$, $p(1) = \infty$.

The radial densities for $n = 3, 4$ are modular functions

Let $\sigma(x) := \frac{3-x}{1+x}$. Then σ is an involution on $[0, 3]$ sending $[0, 1]$ to $[1, 3]$:

$$p_3(x) = \frac{4x}{(3-x)(x+1)} p_3(\sigma(x)). \quad (3)$$

So $\frac{3}{4}p_3'(0) = p_3(3) = \frac{\sqrt{3}}{2\pi}$, $p(1) = \infty$. We found:

$$p_3(\alpha) = \frac{2\sqrt{3}\alpha}{\pi(3+\alpha^2)} {}_2F_1\left(\frac{1}{3}, \frac{2}{3} \mid \frac{\alpha^2(9-\alpha^2)^2}{(3+\alpha^2)^3} \mid 1\right) = \frac{2\sqrt{3}}{\pi} \frac{\alpha}{\text{AG}_3(3+\alpha^2, 3(1-\alpha^2)^{2/3})}$$

where AG_3 is the *cubically convergent mean iteration* (1991):

$$\text{AG}_3(a, b) := \frac{a+2b}{3} \otimes \left(b \cdot \frac{a^2+ab+b^2}{3} \right)^{1/3}.$$

The densities p_3 (L) and p_4 (R)

Formula for the 'shark-fin' p_4

We ultimately deduce on $2 \leq \alpha \leq 4$ a hyper-closed form:

$$p_4(\alpha) = \frac{2}{\pi^2} \frac{\sqrt{16 - \alpha^2}}{\alpha} {}_3F_2 \left(\begin{matrix} \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \\ \frac{5}{6}, \frac{7}{6} \end{matrix} \middle| \frac{(16 - \alpha^2)^3}{108 \alpha^4} \right). \quad (5)$$

← p_4 from (5) vs 18-terms of empirical power series

✓ **Proves** $p_4(2) = \frac{2^{7/3} \pi}{3\sqrt{3}} \Gamma\left(\frac{2}{3}\right)^{-6} = \frac{\sqrt{3}}{\pi} W_3(-1) \approx 0.494233 < \frac{1}{2}$

- Empirically, quite marvelously, we found — and proved by a subtle use of **distributional Mellin transforms** — that on $[0, 2]$ as well:

$$p_4(\alpha) \stackrel{?}{=} \frac{2}{\pi^2} \frac{\sqrt{16 - \alpha^2}}{\alpha} \Re {}_3F_2 \left(\begin{matrix} \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \\ \frac{5}{6}, \frac{7}{6} \end{matrix} \middle| \frac{(16 - \alpha^2)^3}{108 \alpha^4} \right) \quad (6)$$

(Discovering this \Re brought us full circle.)

The radial densities for $5 \leq n \leq 8$

(and large n approximation)

The radial densities for $5 \leq n \leq 8$

(and large n approximation)

Both p_{2n+4}, p_{2n+5} are n -times continuously differentiable for $x > 0$
 with $p_n(x) \sim \frac{2x}{n} e^{-x^2/n}$. So “four is small” but “eight is large.”

The radial densities for $5 \leq n \leq 8$

(and large n approximation)

Both p_{2n+4}, p_{2n+5} are n -times continuously differentiable for $x > 0$
 with $p_n(x) \sim \frac{2x}{n} e^{-x^2/n}$. So “four is small” but “eight is large.”

- Pearson wondered if p_5 was linear on $[0, 1]$. Only disproven in sixties.

Meijer-G (1936) form for W_3

and graph on real line

Theorem (Meijer-G form for W_3)

For s not an odd integer

$$W_3(s) = \frac{\Gamma(1 + \frac{s}{2})}{\sqrt{\pi} \Gamma(-\frac{s}{2})} G_{33}^{21} \left(\begin{matrix} 1, 1, 1 \\ \frac{1}{2}, -\frac{s}{2}, -\frac{s}{2} \end{matrix} \middle| \frac{1}{4} \right).$$

Meijer-G (1936) form for W_3

and graph on real line

Theorem (Meijer-G form for W_3)

For s not an odd integer

$$W_3(s) = \frac{\Gamma(1 + \frac{s}{2})}{\sqrt{\pi} \Gamma(-\frac{s}{2})} G_{33}^{21} \left(\begin{matrix} 1, 1, 1 \\ \frac{1}{2}, -\frac{s}{2}, -\frac{s}{2} \end{matrix} \middle| \frac{1}{4} \right).$$

- First found by Crandall via CAS.
- Proved using **residue calculus** methods.

Meijer-G (1936) form for W_3

and graph on real line

Theorem (Meijer-G form for W_3)For s not an odd integer

$$W_3(s) = \frac{\Gamma(1 + \frac{s}{2})}{\sqrt{\pi} \Gamma(-\frac{s}{2})} G_{33}^{21} \left(\begin{matrix} 1, 1, 1 \\ \frac{1}{2}, -\frac{s}{2}, -\frac{s}{2} \end{matrix} \middle| \frac{1}{4} \right).$$

- First found by Crandall via CAS.
- Proved using **residue calculus** methods.
- $W_3(s)$ is among the first non-trivial higher order Meijer-G function to be placed in closed form.

Meijer-G (1936) form for W_4

Theorem (Meijer form for W_4)

For $\Re s > -2$ and s not an odd integer

$$W_4(s) = \frac{2^s \Gamma(1 + \frac{s}{2})}{\pi \Gamma(-\frac{s}{2})} G_{44}^{22} \left(\begin{matrix} 1, \frac{1-s}{2}, 1, 1 \\ \frac{1}{2}, -\frac{s}{2}, -\frac{s}{2}, -\frac{s}{2} \end{matrix} \middle| 1 \right). \quad (7)$$

Meijer-G (1936) form for W_4

Theorem (Meijer form for W_4)

For $\Re s > -2$ and s not an odd integer

$$W_4(s) = \frac{2^s \Gamma(1 + \frac{s}{2})}{\pi \Gamma(-\frac{s}{2})} G_{44}^{22} \left(\begin{matrix} 1, \frac{1-s}{2}, 1, 1 \\ \frac{1}{2}, -\frac{s}{2}, -\frac{s}{2}, -\frac{s}{2} \end{matrix} \middle| 1 \right). \quad (7)$$

He [Gauss (or Mathematica)] is like the fox, who effaces his tracks in the sand with his tail.— Niels Abel (1802-1829)

Meijer-G (1936) form for W_4

Theorem (Meijer form for W_4)

For $\Re s > -2$ and s not an odd integer

$$W_4(s) = \frac{2^s \Gamma(1 + \frac{s}{2})}{\pi \Gamma(-\frac{s}{2})} G_{44}^{22} \left(\begin{matrix} 1, \frac{1-s}{2}, 1, 1 \\ \frac{1}{2}, -\frac{s}{2}, -\frac{s}{2}, -\frac{s}{2} \end{matrix} \middle| 1 \right). \quad (7)$$

He [Gauss (or Mathematica)] is like the fox, who effaces his tracks in the sand with his tail.— Niels Abel (1802-1829)

But we really need a formula with $s = 1$, that is an **integer**.

Visualizing W_4 , W_5 , and W_6 on the real line

- Use recursion from $s > 1$

Visualizing W_4 , W_5 , and W_6 on the real line

- Use recursion from $s > 1$
- Nonnegativity of W_4 was hard to prove (Wan)

Visualizing W_4 in the complex plane

Visualizing W_4 in the complex plane

- Easily drawn now in *Mathematica* from the Meijer-G representation
- Each point is coloured differently (black is zero and white infinity). Note the poles and zeros.

Visualizing W_4 in the complex plane:

sometimes less is more

- Easily drawn now in *Mathematica* from the Meijer-G representation.
- Each quadrant is coloured differently (black is zero and white infinity). Note the poles and zeros.

Visualizing W_4 in the complex plane:

sometimes less is more

- Less easily drawn now from the Meijer-G representation.
- As prepared for Springer's **Mathematical Beauties** (2016).

Simplifying the Meijer integrals for W_3 and W_4

- We (humans and/or computers) now obtained:

Simplifying the Meijer integrals for W_3 and W_4

- We (humans and/or computers) now obtained:

Corollary (Hypergeometric forms for non-integer $s > -2$)

$$W_3(s) = \frac{\tan\left(\frac{\pi s}{2}\right)}{2^{2s+1}} \binom{s}{\frac{s-1}{2}}^2 {}_3F_2\left(\begin{matrix} \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \\ \frac{s+3}{2}, \frac{s+3}{2} \end{matrix} \middle| \frac{1}{4}\right) + \binom{s}{\frac{s}{2}} {}_3F_2\left(\begin{matrix} -\frac{s}{2}, -\frac{s}{2}, -\frac{s}{2} \\ 1, -\frac{s-1}{2} \end{matrix} \middle| \frac{1}{4}\right),$$

and

$$W_4(s) = \frac{\tan\left(\frac{\pi s}{2}\right)}{2^{2s}} \binom{s}{\frac{s-1}{2}}^3 {}_4F_3\left(\begin{matrix} \frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{s}{2} + 1 \\ \frac{s+3}{2}, \frac{s+3}{2}, \frac{s+3}{2} \end{matrix} \middle| 1\right) + \binom{s}{\frac{s}{2}} {}_4F_3\left(\begin{matrix} \frac{1}{2}, -\frac{s}{2}, -\frac{s}{2}, -\frac{s}{2} \\ 1, 1, -\frac{s-1}{2} \end{matrix} \middle| 1\right).$$

Simplifying the Meijer integrals for W_3 and W_4

- We (humans and/or computers) now obtained:

Corollary (Hypergeometric forms for non-integer $s > -2$)

$$W_3(s) = \frac{\tan\left(\frac{\pi s}{2}\right)}{2^{2s+1}} \binom{s}{\frac{s-1}{2}}^2 {}_3F_2\left(\begin{matrix} \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \\ \frac{s+3}{2}, \frac{s+3}{2} \end{matrix} \middle| \frac{1}{4}\right) + \binom{s}{\frac{s}{2}} {}_3F_2\left(\begin{matrix} -\frac{s}{2}, -\frac{s}{2}, -\frac{s}{2} \\ 1, -\frac{s-1}{2} \end{matrix} \middle| \frac{1}{4}\right),$$

and

$$W_4(s) = \frac{\tan\left(\frac{\pi s}{2}\right)}{2^{2s}} \binom{s}{\frac{s-1}{2}}^3 {}_4F_3\left(\begin{matrix} \frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{s}{2} + 1 \\ \frac{s+3}{2}, \frac{s+3}{2}, \frac{s+3}{2} \end{matrix} \middle| 1\right) + \binom{s}{\frac{s}{2}} {}_4F_3\left(\begin{matrix} \frac{1}{2}, -\frac{s}{2}, -\frac{s}{2}, -\frac{s}{2} \\ 1, 1, -\frac{s-1}{2} \end{matrix} \middle| 1\right).$$

- We (humans) were able to provably **take the limit at ± 1** : e.g.,

$$\begin{aligned} W_4(-1) &= \frac{\pi}{4} {}_7F_6\left(\begin{matrix} \frac{5}{4}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \\ \frac{1}{4}, 1, 1, 1, 1, 1 \end{matrix} \middle| 1\right) = \frac{\pi}{4} \sum_{n=0}^{\infty} \frac{(4n+1) \binom{2n}{n}^6}{4^{6n}} \\ &= \frac{\pi}{4} {}_6F_5\left(\begin{matrix} \frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \\ 1, 1, 1, 1, 1 \end{matrix} \middle| 1\right) + \frac{\pi}{64} {}_6F_5\left(\begin{matrix} \frac{3}{2}, \frac{3}{2}, \frac{3}{2}, \frac{3}{2}, \frac{3}{2}, \frac{3}{2} \\ 2, 2, 2, 2, 2 \end{matrix} \middle| 1\right). \end{aligned}$$

Hypergeometric values of W_3 :

from Meijer-G values.

With much work involving moments of **elliptic integrals** we obtain:

Theorem (Tractable hypergeometric form for W_3)

(a) For $s \neq -3, -5, -7, \dots$, we have

$$W_3(s) = \frac{3^{s+3/2}}{2\pi} \beta\left(s + \frac{1}{2}, s + \frac{1}{2}\right) {}_3F_2\left(\begin{matrix} \frac{s+2}{2}, \frac{s+2}{2}, \frac{s+2}{2} \\ 1, \frac{s+3}{2} \end{matrix} \middle| \frac{1}{4}\right). \quad (8)$$

(b) For every natural number $k = 1, 2, \dots$,

$$W_3(-2k-1) = \frac{\sqrt{3} \binom{2k}{k}^2}{2^{4k+1} 3^{2k}} {}_3F_2\left(\begin{matrix} \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \\ k+1, k+1 \end{matrix} \middle| \frac{1}{4}\right).$$

The Stoneham numbers

$$\alpha_{b,c} = \sum_{n=1}^{\infty} \frac{1}{c^n b^{c^n}}$$

1973 Richard Stoneham proved some of the following (nearly 'natural') constants are b -normal for relatively prime integers b, c :

$$\alpha_{b,c} := \frac{1}{cb^c} + \frac{1}{c^2 b^{c^2}} + \frac{1}{c^3 b^{c^3}} + \dots$$

Such **super-geometric** sums are **Stoneham constants**. To 10 places

$$\alpha_{2,3} = \frac{1}{24} + \frac{1}{3608} + \frac{1}{3623878656} + \dots$$

The Stoneham numbers

$$\alpha_{b,c} = \sum_{n=1}^{\infty} \frac{1}{c^n b^{c^n}}$$

1973 Richard Stoneham proved some of the following (nearly 'natural') constants are b -normal for relatively prime integers b, c :

$$\alpha_{b,c} := \frac{1}{cb^c} + \frac{1}{c^2 b^{c^2}} + \frac{1}{c^3 b^{c^3}} + \dots$$

Such **super-geometric** sums are **Stoneham constants**. To 10 places

$$\alpha_{2,3} = \frac{1}{24} + \frac{1}{3608} + \frac{1}{3623878656} + \dots$$

Theorem (Normality of Stoneham constants, Bailey–Crandall '02)

For every coprime pair of integers $b \geq 2$ and $c \geq 2$, the constant $\alpha_{b,c}$ is b -normal.

The Stoneham numbers

$$\alpha_{b,c} = \sum_{n=1}^{\infty} \frac{1}{c^n b^{c^n}}$$

1973 Richard Stoneham proved some of the following (nearly 'natural') constants are b -normal for relatively prime integers b, c :

$$\alpha_{b,c} := \frac{1}{cb^c} + \frac{1}{c^2 b^{c^2}} + \frac{1}{c^3 b^{c^3}} + \dots$$

Such **super-geometric** sums are **Stoneham constants**. To 10 places

$$\alpha_{2,3} = \frac{1}{24} + \frac{1}{3608} + \frac{1}{3623878656} + \dots$$

Theorem (Normality of Stoneham constants, Bailey–Crandall '02)

For every coprime pair of integers $b \geq 2$ and $c \geq 2$, the constant $\alpha_{b,c}$ is b -normal.

Theorem (Nonnormality of Stoneham constants, Bailey–Borwein '12)

Given coprime $b \geq 2$ and $c \geq 2$, such that $c < b^{c-1}$, the constant $\alpha_{b,c}$ is bc -nonnormal.

The Stoneham numbers

$$\alpha_{b,c} = \sum_{n=1}^{\infty} \frac{1}{c^n b^{c^n}}$$

1973 Richard Stoneham proved some of the following (nearly 'natural') constants are b -normal for relatively prime integers b, c :

$$\alpha_{b,c} := \frac{1}{cb^c} + \frac{1}{c^2 b^{c^2}} + \frac{1}{c^3 b^{c^3}} + \dots$$

Such **super-geometric** sums are **Stoneham constants**. To 10 places

$$\alpha_{2,3} = \frac{1}{24} + \frac{1}{3608} + \frac{1}{3623878656} + \dots$$

Theorem (Normality of Stoneham constants, Bailey–Crandall '02)

For every coprime pair of integers $b \geq 2$ and $c \geq 2$, the constant $\alpha_{b,c}$ is b -normal.

Theorem (Nonnormality of Stoneham constants, Bailey–Borwein '12)

Given coprime $b \geq 2$ and $c \geq 2$, such that $c < b^{c-1}$, the constant $\alpha_{b,c}$ is bc -nonnormal.

- Since $3 < 2^{3-1} = 4$, $\alpha_{2,3}$ is **2-normal** and **6-nonnormal** !

The Stoneham numbers

$$\alpha_{b,c} = \sum_{n=1}^{\infty} \frac{1}{c^n b^{c^n}}$$

Figure: $\alpha_{2,3}$ is 2-normal (top) but 6-nonnormal (bottom). Is seeing believing?

The Stoneham numbers

$$\alpha_{b,c} = \sum_{n=1}^{\infty} \frac{1}{c^n b^{c^n}}$$

Figure: Is $\alpha_{2,3}$ 3-normal or not?

Number of points visited

For a 2D lattice

- The **expected number** of distinct **points visited** by an N -step random walk on a two-dimensional lattice behaves for large N like $\pi N / \log(N)$ (Dvoretzky–Erdős, **1951**).

Number of points visited

For a 2D lattice

- The **expected number** of distinct **points visited** by an N -step random walk on a two-dimensional lattice behaves for large N like $\pi N / \log(N)$ (Dvoretzky–Erdős, **1951**).
- **Practical problem:** Convergence is slow ($O(N \log \log N / (\log N)^2)$).

Number of points visited

For a 2D lattice

- The **expected number** of distinct **points visited** by an N -step random walk on a two-dimensional lattice behaves for large N like $\pi N / \log(N)$ (Dvoretzky–Erdős, **1951**).
- **Practical problem:** Convergence is slow ($O(N \log \log N / (\log N)^2)$).
- **1988** D. Downham and S. Fotopoulos gave better bounds on the expectation. It lies in:

$$\left(\frac{\pi(N + 0.84)}{1.16\pi - 1 - \log 2 + \log(N + 2)}, \frac{\pi(N + 1)}{1.066\pi - 1 - \log 2 + \log(N + 1)} \right).$$

Number of points visited

For a 2D lattice

- The **expected number** of distinct **points visited** by an N -step random walk on a two-dimensional lattice behaves for large N like $\pi N / \log(N)$ (Dvoretzky–Erdős, **1951**).
- **Practical problem:** Convergence is slow ($O(N \log \log N / (\log N)^2)$).
- **1988** D. Downham and S. Fotopoulos gave better bounds on the expectation. It lies in:

$$\left(\frac{\pi(N + 0.84)}{1.16\pi - 1 - \log 2 + \log(N + 2)}, \frac{\pi(N + 1)}{1.066\pi - 1 - \log 2 + \log(N + 1)} \right).$$

- For example, for $N = 10^6$ these bounds are $(199256.1, 203059.5)$, while $\pi N / \log(N) = 227396$, which **overestimates** the expectation.

Catalan's constant

$$G = 1 - 1/4 + 1/9 - 1/16 + \dots$$

Rational number Q_2	1,000,000	939,322	199,256	203,060

Normal numbers need not be so “random” ...

Figure: Champernowne $C_{10} = 0.123456789101112\dots$ (normal).
 Normalized distance to the origin: **15.9** (50,000 steps).

Normal numbers need not be so “random” ...

Figure: Champernowne $C_4 = 0.123101112132021\dots$ (normal).
 Normalized distance to the origin: **18.1** (100,000 steps).
 Points visited: **52760**. Expectation: (23333, 23857).

Normal numbers need not be so “random” ...

Figure: Stoneham $\alpha_{2,3} = 0.0022232032\dots_4$ (normal base 4).
 Normalized distance to the origin: **0.26** (1,000,000 steps).
 Points visited: **95817**. Expectation: (199256, 203060).

Normal numbers need not be so “random” ...

Figure: Stoneham $\alpha_{2,3} = 0.0022232032\dots_4$ (normal base 4).
 Normalized distance to the origin: **0.26** (1,000,000 steps).
 Points visited: **95817**. Expectation: (199256, 203060).

$\alpha_{2,3}$ is 4-normal but not so “random”

ANIMATION

Figure: A pattern in the digits of $\alpha_{2,3}$ base 4. We show only positions of the walk after $\frac{3}{2}(3^n + 1)$, $\frac{3}{2}(3^n + 1) + 3^n$ and $\frac{3}{2}(3^n + 1) + 2 \cdot 3^n$ steps, $n = 0, 1, \dots, 11$.

Experimental conjecture

Proven 12-12-12 by Coons

Theorem (Base-4 structure of Stoneham $\alpha_{2,3}$)

Denote by a_k the k^{th} digit of $\alpha_{2,3}$ in its base 4 expansion:
 $\alpha_{2,3} = \sum_{k=1}^{\infty} a_k/4^k$, with $a_k \in \{0, 1, 2, 3\}$ for all k . Then, for all $n = 0, 1, 2, \dots$
 one has:

$$(i) \quad \sum_{k=\frac{3}{2}(3^n+1)}^{\frac{3}{2}(3^n+1)+3^n} e^{a_k \pi i/2} = \begin{cases} -i, & n \text{ odd} \\ -1, & n \text{ even} \end{cases};$$

$$(ii) \quad a_k = a_{k+3^n} = a_{k+2 \cdot 3^n} \text{ if } k = \frac{3(3^n+1)}{2}, \frac{3(3^n+1)}{2} + 1, \dots, \frac{3(3^n+1)}{2} + 3^n - 1.$$

Likewise, $\alpha_{3,5}$ is 3-normal ... but not very “random”

Automatic numbers: Thue–Morse and Paper-folding

Automatic numbers are never normal. They are given by simple but fascinating rules...giving structured/boring walks:

Figure: Paper folding. The sequence of left and right folds along a strip of paper that is folded repeatedly in half in the same direction. **Unfold** and read 'right' as '1' and 'left' as '0': **1 0 1 1 0 0 1 1 1 0 0 1 0 0**

Automatic numbers: Thue–Morse and Paper-folding

Automatic numbers are never normal. They are given by simple but fascinating rules... giving structured/boring walks:

Figure: Paper folding. The sequence of left and right folds along a strip of paper that is folded repeatedly in half in the same direction. **Unfold** and read 'right' as '1' and 'left' as '0': **1 0 1 1 0 0 1 1 1 0 0 1 0 0**

Thue–Morse constant (transcendental; 2-automatic, hence nonnormal):

$$TM_2 = \sum_{n=1}^{\infty} \frac{1}{2^{t(n)}} \text{ where } t(0) = 0, \text{ while } t(2n) = t(n) \text{ and } t(2n+1) = 1 - t(n)$$

0.01101001100101101001011001101001...

Automatic numbers: **Thue–Morse and Paper-folding**

Automatic numbers are never normal. They are given by simple but fascinating rules...giving structured/boring walks:

(a) 1,000 bits of Thue–Morse sequence.

(b) 10 million bits of paper-folding sequence.

Figure: Walks on two automatic and so nonnormal numbers.

Automatic numbers:

Turtle plots look great!

(a) Ten million digits of the paperfolding sequence, rotating 60° .

(b) One million digits of the paperfolding sequence, rotating 120° (a dragon curve).

(c) 100,000 digits of the Thue-Morse sequence, rotating 60° (a Koch snowflake).

(d) One million digits of π , rotating 60° .

Figure: Turtle plots on various constants with different rotating angles in base 2—where '0' yields forward motion and '1' rotation by a fixed angle.

Ⓜ Chromosomes look less like π and more like concatenation numbers?

DNA for Storage:

We are all base 4 numbers (ACGT/U)

News > Science > Biochemistry and molecular biology

Shakespeare and Martin Luther King demonstrate potential of DNA storage

All 154 Shakespeare sonnets have been spelled out in DNA to demonstrate the vast potential of genetic data storage

Ian Sample, science correspondent
The Guardian, Thursday 24 January 2013
[Jump to comments \(...\)](#)

When written in DNA, one of Shakespeare's sonnets weighs 0.3 millionths of a millionth of a gram. Photograph: Oli Scarff/Getty

Figure: The potential for DNA storage (L) and the quadruple helix (R)

The end

with some fractal dessert

The end

with some fractal dessert

Thank you
